Time in Golden Zone

Time in golden zone is the time interstitial glucose values are 80 or less. The screenshot attached is all values less than 80 for the most recent 12 hour period. That is after yesterday's PM meal and before any additional food ingestion in AM.

This is a continuous record of the low glycemic availability zone of my interstitial fluids and at these values my immune cells seem to be their happiest and functioning well. A fact that is subjectively submitted because of recently improved sleep with increased REMs. As well as improving superficial wound healing. Notable increase in energy levels. The hair on my head seems to be growing faster and perhaps healthier. The meal eaten after this data was collected is as follows: 1 small pork sausage patty well drained, 1/3 cup oats, 15 grams of aged cheddar cheese, 2 tablespoons mixed nuts, 1 cup whole milk kefir, 1 tablespoon sweet potato, Large green mixed salad with some tomatoes and 1/2 avocado. And a sprinkle of “Real” salt.

Screenshot of Latest 12 PM - 12 AM Readings.

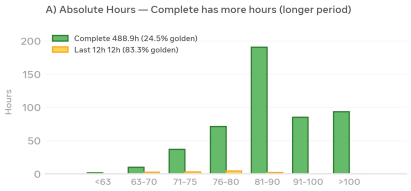

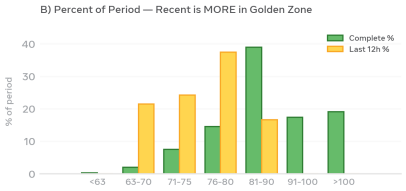

1) Complete: 119.58 h at <=80 of 488.92 h = **24.5%** — AUC <=80 = 542,410 — Deficit = 31,590 — Avg 75.6 — **GREEN = Complete**

2) Last 24 h: 13.50 h at <=80 of 24.00 h = **56.2%** — AUC <=80 = 60,710 — Deficit = 4,090 — Avg 75.0

3) Last 12 h: 10.00 h at <=80 of 12.00 h = **83.3%** — AUC <=80 = 44,465 — Deficit = 3,535 — Avg 74.1 — **GOLD (yellow) = Recent 12h / Golden Zone**

Method: Historic only, Record Type 0, 5-min grid. A) Absolute hours shows Complete larger because longer period. B) Percent shows Recent MORE in Golden Zone.

Complete dataset. 2026-10-13 to 2026-11-06 10:26 — 5,867 points — 24.5% Golden — GREEN
