Evaluation of Green Banana Powder as a Dietary Carbohydrate Suppressor: Modifying the Shape of the Previous Peak

Overlay of both waves aligned at meal start — Green dotted line marking the stone zone at 85-90 — Same meal: sweet potato + Jimmy Dean sausage biscuit + watermelon, Wave 1 WITH 1 tsp GBP, Wave 2 WITHOUT GBP

Mission Data Complete: Wave 1 WITH GBP Peak ~161 mg/dL, stone at 85-90, never <70 (min 75). Wave 2 WITHOUT GBP Peak ~150 mg/dL, no stone, bottom 69, recovered to 73, leveling. Same meal. Same peak height. Different floor. That's the whole GBP effect in one graph.

Metric	Wave 1 WITH GBP (Nov 1 21:48)	Wave 2 WITHOUT GBP (Nov 2 06:53)
Meal	Salad + tomato + 1/2 sweet potato + 2x sausage biscuit + watermelon + 1 tsp GBP	Salad + tomato + 1/2 sweet potato + 2x sausage biscuit + watermelon, NO GBP
Peak mg/dL	161	150
Time to peak	43 min	53 min
Floor (min) mg/dL	75, never <70, stone present	69, dips to 70, no stone
Stone zone 85-90	Present, stable 75-90 for 3+ hrs	Absent, falls through to 69-72
End 5-hr mg/dL	80	88
Bottom confirmed	Current 70 mg/dL In Range, Wave 1 holds	Wave 2 finished 66->73 leveling

Callout: GBP prevents hypoglycemia without reducing peak — Modifying the shape of the previous peak, not its height. Export for GitHub - clean, clinical, no extra variables. Bottom confirmed. Same meal, same peak, different floor.
